

# Causal Complexity

Another important benefit of set theoretic analysis is that it is much more compatible with the analysis of causal complexity than conventional techniques. Example: a researcher studies production sites in a strike-prone industry and considers four possible causes of strikes:

technology = the introduction of new technology

wages = stagnant wages in times of high inflation

overtime = reduction in overtime hours

sourcing = outsourcing portions of production

Possible findings include:

(1) technology  $\rightarrow$  strikes

(2) technology  $\cdot$  wages  $\rightarrow$  strikes

(3) technology + wages  $\rightarrow$  strikes

(4) technology  $\cdot$  wages + overtime  $\cdot$  sourcing  $\rightarrow$  strikes

In (1) technology is necessary and sufficient; in (2) technology is necessary but not sufficient; in (3) technology is sufficient but not necessary; in (4) technology is neither necessary nor sufficient. The fourth is the characteristic form of causal complexity: no cause is either necessary or sufficient.

## INUS Causation

In situations of *causal complexity*, no single cause may be either necessary or sufficient, as in the logic equation:

TECHNOLOGY\*WAGES + OVERTIME\*SOURCING → STRIKES

In *The Comparative Method*, this situation is called “multiple conjunctural causation.”

In *The Cement of the Universe*, Mackie labels these causal conditions INUS causes because each one is:

**I**nsufficient (not sufficient by itself) but  
**N**ecessary components of causal combinations that are  
**U**nnecessary (because of multiple paths) but  
**S**ufficient for the outcome

## The Problem with Examining INUS Causes One at a Time

|                 | X absent   | X present  |
|-----------------|--|--|
| Outcome present | There are cases here because there are several recipes for the outcome, including some that do not involve X           | There are cases here because X is an INUS condition--an ingredient in at least one of the recipes for the outcome                            |
| Outcome absent  | There are cases here because some cases lack the outcome and also lack membership in the recipes that do not include X | There are cases here because X sometimes occurs without the other ingredients that it must be combined with in order to generate the outcome |

Don't forget: Almost all conventional statistical procedures are based on matrices of bivariate correlations. If INUS causes are involved, these correlations are almost completely useless.

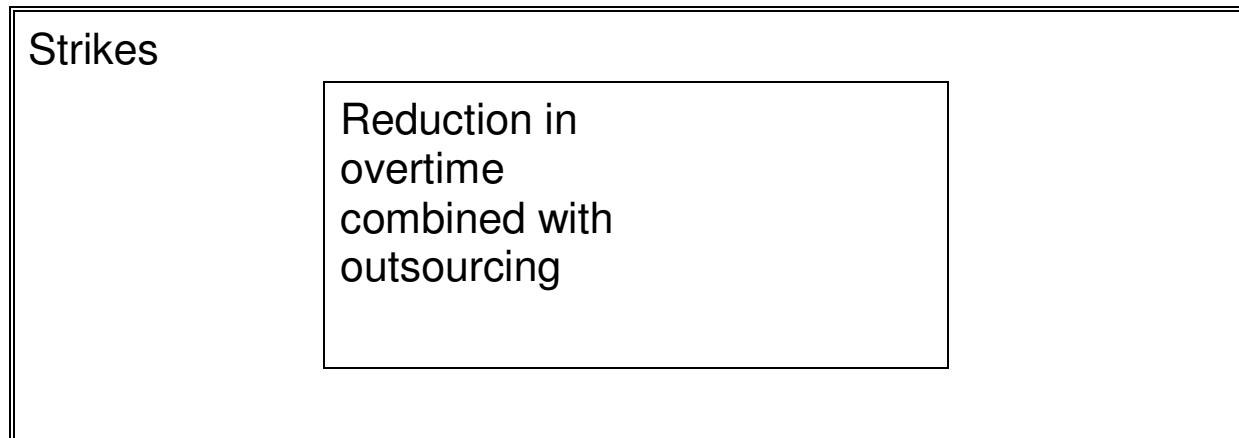

## Assessing Causal Complexity

**I. Logical equation:** technology·wages + overtime·sourcing → strikes

**II. Formulated as a partial crosstabulation:**

|                    | Second causal combination absent | Second causal combination present |
|--------------------|----------------------------------|-----------------------------------|
| Strike present (1) | Cell 1: 20 cases                 | Cell 2: 23 cases                  |
| Strike absent (0)  | Cell 3: 18 cases                 | Cell 4: 0 cases                   |

**III. Expressed as a Venn diagram:**

The key to assessing the sufficiency of a combination of conditions, even if it is one among many recipes, is to select on instances of the combination and assess whether these instances agree on the outcome.

## SIMPLE EXAMPLE OF QCA USING HYPOTHETICAL DATA

### A. Truth Table:

| <i><b>C</b></i> | <i><b>L</b></i> | <i><b>H</b></i> | <i><b>G</b></i> | <i><b>U</b></i> | <i><b>N of Cases</b></i> |
|-----------------|-----------------|-----------------|-----------------|-----------------|--------------------------|
| 0               | 0               | 0               | 0               | 0               | 4                        |
| 0               | 0               | 0               | 1               | 0               | 3                        |
| 0               | 0               | 1               | 0               | 0               | 6                        |
| 0               | 0               | 1               | 1               | 1               | 2                        |
| 0               | 1               | 0               | 0               | 1               | 3                        |
| 0               | 1               | 0               | 1               | 1               | 4                        |
| 0               | 1               | 1               | 0               | 0               | 3                        |
| 0               | 1               | 1               | 1               | 1               | 5                        |
| 1               | 0               | 0               | 0               | 0               | 7                        |
| 1               | 0               | 0               | 1               | 0               | 8                        |
| 1               | 0               | 1               | 0               | 0               | 1                        |
| 1               | 0               | 1               | 1               | 1               | 7                        |
| 1               | 1               | 0               | 0               | 1               | 3                        |
| 1               | 1               | 0               | 1               | 1               | 2                        |
| 1               | 1               | 1               | 0               | 0               | 7                        |
| 1               | 1               | 1               | 1               | 1               | 6                        |

C = Corporatist wage negotiations

L = At least five years of rule by Left or Center-Left parties

H = Ethnic-cultural homogeneity

G = At least ten years of sustained economic growth

U = Adoption of universal pension system

## B. Table simplified through row-wise comparisons (positive outcomes only)

- 10- (or L•h: Left rule combined with ethnic diversity)
- 1-1 (or L•G: Left rule combined with economic growth)
- 11 (or H•G: ethnic homogeneity combined with economic growth)

Dashes indicate that a condition has been eliminated (found to be irrelevant)

## C. Finding redundant terms:

*Terms to be Covered (Rows with Outcome = 1)*

|                       |      | 0100 | 1100 | 0101 | 1101 | 0011 | 1011 | 0111 | 1111 |
|-----------------------|------|------|------|------|------|------|------|------|------|
| <i>Simplified</i>     | -10- | x    | x    | x    | x    |      |      |      |      |
| <i>Terms (from B)</i> | -1-1 |      |      | x    | x    |      |      | x    | x    |
|                       | --11 |      |      |      |      | x    | x    | x    | x    |

## D. Final results (logically minimal):

$$U = L \cdot h + H \cdot G$$

Lower-case letters indicate condition must be absent.

Upper-case letters indicate that condition must be present.

Multiplication (•) indicates combined conditions (logical *and*).

Addition (+) indicates alternate combinations (logical *or*).
